Top 10 Countries by Estimated TB Cases – 2024

Top 10 Countries by TB Incidence Rate - 2024

High-High TB Priority Countries - 2024

Priority Score = 50% relative burden + 50% relative incidence.

Methodology: High-High = $\geq 100K$ estimated TB cases AND ≥ 300 cases per 100K population. Priority Score weights burden and incidence equally.

Countries combining $\geq 100K$ estimated cases and ≥ 300 cases per 100K population

Executive Takeaway:

TB burden and disease intensity are not concentrated in the same countries. Seven countries combine substantial estimated case volume with high population-adjusted incidence and therefore emerge as priority countries for further resource-allocation assessment.

Next question: Are current resources aligned with these areas of greatest need?

TB Burden vs Program Budget | High-Burden Countries

2024 estimated cases vs cumulative 2018 - 2024 reported budget

Executive Takeaway

Reported TB program expenditure reached **68.5% of budget during 2018–2024**, with substantial variation in resource utilization.

Staff utilization (92.1%) substantially exceeded laboratory utilization (38.3%).

Among high-burden countries with complete financial reporting, **Viet Nam, Indonesia, Pakistan and the Philippines reported utilization near or below one-third**, highlighting areas for further investigation of resource deployment and alignment with TB burden.

Reporting note: Country utilization comparisons include complete 2018–2024 financial reporters. Countries with incomplete expenditure reporting are excluded from the utilization ranking.
